

## ROW ACCURACY ACTIVITY

When the teacher tells you to start, look at the previous step. If the step is correct, then initial the step and work ONLY the next step. If the step is incorrect, fix it, initial it, and then move on and work ONLY the next step.

Problem 1	Simplify the Expression: $(4x + 8y) + (3x - 5y)$	Initial Here					
Step 1: Model with cards.		<table border="1" style="width: 100%; height: 40px;"> <tr> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> </tr> </table>					
Step 2: Re-group with cards.		<table border="1" style="width: 100%; height: 40px;"> <tr> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> </tr> </table>					
Step 3: Write the re-grouped expression algebraically.		<table border="1" style="width: 100%; height: 40px;"> <tr> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> </tr> </table>					
Step 4: Simplify the expression.		<table border="1" style="width: 100%; height: 40px;"> <tr> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> </tr> </table>					
Step 5: Verify the answer.		<table border="1" style="width: 100%; height: 40px;"> <tr> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> <td style="width: 20%;"></td> </tr> </table>
